My dear Dr

Thy letter of 8th came duly to hand, I enclose herewith all the Ammania I have, I do not know that it was found in very great abundance, and has not been seen for some time

Yes, pods of Catalpa came, hope to get them etc. of flowers & leaves next year. I have been very much engaged this winter & accomplished but little botanically, but I will be ready for the fields again when they are ready for me.

All are well in these parts so far as I know, hope to hear now and then from my friend.

Resp

3/ ~~Obstaflora~~

Geo Engelmann.

Yours of 11th rec'd this

A.M. I enclose 3 parcels numbered 1, 2, & 3.

No 1. I take it is the true gronovii

from Eastern Penna, where I have been

familiar with it for 10 years past and

have never noticed any material difference,

No 2 is from near Camden, and apparent

ly identical with No 1 the flowers are

all 5 parted, and like No 1, seems to prefer

smaller plants, and of finer forms, growing

on Impatiens, Polygonums, & some of the

smaller Compositae, No 3. seems to be

of different habit somewhat, growing over

shrubs the Coarser Composita and in

one or two instances on the bark and

low branches of the willows that border

the stream, all that I can find is

within reach of tide-water the flowers

0 1 2 3 4 5 6 7 8 9 10
cm
copyright reserved
MISSOURI BOTANICAL GARDEN

are as you say indescriminately 4 & 5
parted, much smaller than either
No 1 or 2. Some of the fruit is perfectly
globose, some of it flattened as in the
specimen you send. and none that
I can find so marked umbonate as
either of the others enclosed. I have
never seen the North eastern form from
Connecticut described in Gray with 4-
parted flowers. It may prove to be
only a form, perhaps a variety,
but do you not think it too far away
to be the true Gronovii?

Respectfully
J. C. Martindale

Camden, N. J. Oct 9 1873

Dr G Engelmann

I Enclose herewith
some more Specimens of C Gronovii
apart of them being in the diseased
state, I went yesterday about 14 miles
to get it, and found most of that form
disappearing, owing doubtless to the
lateness of the season. I have sent
some plants to Prof C H Peck Albany
N. Y. having understood he is author-
ity on such things, and will inform
you, as he reports; in regard to the
mould you say was on your plants
it must have been formed in transition
in the box, as the whole surface is
smooth and shining when packed, it
may nevertheless belong to the spores, and
the packing and carrying facilitate the
production of the plant in that condition

0 1 2 3 4 5 6 7 8 9 10
cm
copyright reserved
MISSOURI BOTANICAL GARDEN

The only locality I have found this state is in a low piece of ground. Some iron in the soil very swampy and pool of stagnant water. I think the whole fruiting is larger than I have been accustomed to see in this section of C. Gronovii. is it identical with what you had previously seen, as you say you had found in that state before.

I learn that you have prepared some sets of Juncus, are they all disposed of? My collection is still meagre as well as in other orders, any duplicate plants you may have I should be glad to receive, if I can furnish you with anything as an offset—

Respectfully

Dear Friend.

Your letter of 28 just rec'd. also your Juncus, &c, please accept my thanks therefor I will endeavor to furnish you with some of our plants in return, if you are in want of any special plants please designate, if I have no spec. will endeavor in the future, to serve you. Mr Parker is one of the best botanists in this part of the State and has a very large private collection, he has a great drawback in failing eyesight still we journey together very much, and I lend him my eyes, so to speak, when occasion requires. I collected some Isoetes near Toms River along the coast. intending to send to you, but it seems to have been mislaid at present. I am just now engaged in rearranging my collection

I have put up a package of plants to send by Express. They are such as I happen to have duplicates of most of them belonging to this section of the County. I add to them a specimen or more as I have of all the Juncus collected here, by me and have retained a specimen of each. I would be glad if you would examine them and return me the labels with the correct names. I have numbered the labels that I can identify them if returned, or if more convenient send me if you please their names on a sheet according to their order commencing with No 1. — I hope you may find among the lot something of interest.

Dr. Geo Engelman

I notice you have been making some observations on the fungus on the grape. I have in my yard an "Ives" which for 3 years past loses its leaves in the latter part of summer by their withering away, considerably in advance of the leaves on "Hartford prolific" or "Concord" growing in close proximity. I have noticed the black spots on the veins on the under side for some time, and have guessed if this was the cause. Is it a fungus? and by what name is it known?

Yours truly

Postal rec'd, Am glad to have my own judgment confirmed, on the Opuntia vulgaris, Having compared it with your figures in the Pacific R.R. Reports. I could not see that it could be otherwise than O. vulgaris. I have never collected any other here. This grows on a sandy knoll near Haddonfield N.J. about 6 miles from Camden, Not abundant, but occurs here and there over the space of an acre or two, I have now had an opportunity to examine the specimens from the sea coast which are said to be Rafinesquii, I spoke to Meehan last Tuesday at the Academy of Nat. Sciences Phila, that I had what I believed was the true O. vulgaris & that I had sent it to you for confirmation, he said his plant was O. Rafinesquii, I will go out and get another plant for Meehan. There is no doubt about its being a native, It is growing on a piece of land owned by Our President John Gill, who tells me it has been there twenty five years or more

The National State Bank of Camden.

Camden, N. J. 5/8 1877

My dear Dr Engelmann —

Your letter of 28th came duly to hand, I had it on my mind to go down to the hybrids.[s] when I thought they were in the right condition for you, remembering the conversation with you last fall, on their veriation, and yet I felt a sense of fear to go down, for I had heard the stuff of wood had been sold and the trees were nearly all cut down, but I nevertheless concluded to risk it, so went down, and found to my great delight the woodman's axe had not been laid at the roots of our trees. they are still standing how long they will remain is uncertain I hope long enough to let me get a good lot of acorns in the fall. You ask how to designate the locality. "on the West Jersey Rail Road, near Park Station about 6½ miles from Camden New Jersey." (I can vouch for the distance for I had to walk it facing a cold North East storm) I send you a box by express to-day. the different layers marked so you can understand them, I kept the 4 marked trees all separate some of the branches you will see bear the marks of where we cut off specimens last fall. I also endose Quercus Phellos which seems to be a very different thing entirely, also Q. falcata, which comes nearer but is evidently distinct. if this bicolor-phylla proves to be a hybrid it is much nearer falcata than phellos both in fruit and foliage. I would be glad to know your version when you come to judgment on them. —

I send you in abundance as I may not be able to get any more, if the balance of the woodland is cleared off.

I have received from Eggert a large lot of specimens, I wrote to him a few days ago in regard to a specimen sent as Corydalis flavula, there has been some confusion between it and aurea, but Gray's last edition makes them distinct I think his plant is aurea, and asked him to submit the

National State Bank,

Camden, N. J. 10/29 187?

Why dear Dr Engelmann

I send by express to day a package for you, of oaks coll. this year, a goodly supply of heterophylla; if as I'm afraid, the woods will all be cut away this winter, we will not be able to get any more. I enclose herewith a numbered list to correspond with the labels with the specimens will you please note thereon any remarks relative to the specimens or alterations of names if there be any. and return said list to me again. I collected near here about (4 miles away) Pinus serotina a short time ago, now regarded I believe only a variety of rigida. You remember Pursh recorded it from New Jersey, but later Michaux said confines to the Maratime district of the Southern states. There was a little clump of 4 trees within 10 yards of each other. Pinus rigida leaves as usual 2 to 3 inches long. P. serotina

0 1 2 3 4 5 6 7 8 9 10 cm
copyright reserved
MISSOURI BOTANICAL GARDEN

with leaves 6 to 8 inches long. P. inops common here about, and P. virginiana now very rare in New Jersey. I do not know where to find another tree, P. mitis had but one cone, P. serotina but two or three, rigida a few and inops an abundance.

Will be pleased to hear from you soon.

Yours

J. C. Martindale

P. S. I have duplicates of all the specimens sent. and have numbered them so as to identify with the list.

Rec Nov 26
Ans — 27

National State Bank,

Camden, N. J. 11/23 1877

My dear Dr Engelmann

Yours of 15th recd, thanks for your criticisms, as regard Pinus sylla I am confident the specimens I sent you were correctly Numbered, Mr Parker was with me at the time, and he says there can be no mistake about them, every parcel was placed in a separate bundles and marked then and there 1. 2. 3. 4 have been kept separate ever since and no body laid a finger to them except myself. so there is no possible doubt of a mixing up. I thought you were right in Nos 1 & 2 growing together, but to be sure of it I went down to the locality yesterday to make assurance doubly sure, the marks are on all the trees yet and you are right in the position of their growth, the woodmans axe has been at work about 10 yards off and these trees must soon go down I fear. ——

Now about Pinus serotina, that it is not a good species I concur, the length of leaf is marked however, the shape of the cone differs somewhat, and I enclose herewith some of the seeds the difference is not very great, in them the color of the wing is peculiar, yes the cones of rejida, inops, mitis, and the so called serotina all have opened for me, I send by this mail some shellbarks, "Microcarpa" I dont know and cannot find Sulcata I am not sure of in this section In the box No 1 I take to be C. tomentosa, No 2 has just been sent to me as C. tomentosa var Mexicana, it is "as large as an apple" sure enough, No 3 I have just rec'd. also from Eaton Penna as Sulcata, but is it anything more than alba. I would be obliged if you can "open" them a little to my understanding, particularly Nos 2 and 3. —

MISSOURI BOTANICAL GARDEN

I will write to Mrs. Schott in regard to her husbands collection, but I can tell very little about it unless I had a list of species, it is probable I have most of the plants (Candy would have more than I) and there is not telling what shape they are in whether eaten by insects or how they look. and the price they fix what I that. S at any rate I will write her and retain the letter & you do till I hear from her

- Yours as ever

Isaac Martindale

P.S. I have found a lot of Pinus Mitis as handsome trees as ever Mortal eyes looked up ato a few cones of this years setting, still fewer of last years now just ripened, but an abundance of old ones which probably discharged their seed last year, and the cones still remaining on the trees empty, does this periodicty run through pines as I hear farmers say apple trees bear only in abundance every 2 or 3 years. I have to write to Sargent, that there is very little hope, sent him 3 cones however dont know what next year will do for those trees either, they are evidently on the wane and no new ones coming on even from the abundance of seed that must have been emptied out of the cones last year.

My dear Dr Engelmann

Arrived home safely having had a delightful excursion into Colorado— I collected the enclosed while on the way; can you speak for them—

No 1. Collected at Idaho Springs also at Boulder

No 2. Cercocarpus? Ledifolius? in Glen Eyrie near the Garden of the Gods—

No 3. Opuntia Missouriensis? Same locality as No 2. This seems as if it might be a seedling plant of Opuntia Missouriensis, I have occasionally seen here seedlings of O. Rafinesquii taking this terete form.

Please refer by numbers, and I will be able to identify.

Yesterday I went to Woodbury to look after our oaks, thinking to get a quantity

0 1 2 3 4 5 6 7 8 9 10
cm
copyright reserved
MISSOURI BOTANICAL GARDEN

of acorns of L. heterophylla, and lo;
everything gone, the marked trees all
cut and hauled away could not even
find the stumps with certainty. the
stump on the opposite side of the road
too is being all grubbed over and
cleared off. I am sorry it is so; in
a search through the woods surrounding
there I failed to find any other trees.
Do you remember a plant in Shaws garden
labeled Boltonia asteroides that we were looking
at, it was just coming into flower, Mr Mondl
has sent me some of the seeds, it is a curious
thing so far I cannot make anything out of it.
B. asteroides is an uncertain plant.
Hope your wife has returned with improved
health, and yourself rejuvenated.

Respectfully
J. Engelmann

My dear Dr —

Thanks for paper on California Flora — and I am glad to know of an improved condition, a change is beneficial, I found it to last year when I went to Colorado, and I feel the need of it this year when I cannot get away. I send by Express to day a box. prepaid. — on top is the New Jersey coll. I dried them all and have named them, thinking it might save some work in comparing. I think it was a full days work. about 84 species more perhaps than my gonny eyes would see. What is the species of Cuscuta, I never saw it down there. The Orders that we went over at my house, I have fastened down as I have concluded to do so with my coll. after they are all studied, and as I desire to fasten down the Oaks to prevent the acorns getting away, I have taken the liberty of sending them out,

0 1 2 3 4 5 6 7 8 9 10
cm
copyright reserved
MISSOURI BOTANICAL GARDEN

for them to run over, and see if they are correct
a few are not named, the same have I done
with Acanthobrim ex. It will be seen that I
am poorly supplied with the California Oaks,
If they can fill up any of the vacancies I would
be greatly obliged. My suggestion is send a
list of the Numbers of the Lindheimer coll.
not named, I have considered, and have thought
it would be less bother for them to see the
specimens instead, I have therefore included
it in the box. with the others, I am in
no hurry for the return of these, look over
them at convenience, and when through
send back by Express, at my expense,
I put in all the oaks I have, even those
there can be no question about, as I intend
to keep them all in the order (alphabetic)
that I had them in. Spent day before yes-
terday with Meehan at his home, all well
there, as well as our Phila friends gener-
ally. Canby was up a few days ago, looking
as well as ever. — I learn Palmer is
off to Mexico again after the good things,

Yr. friend

My dear Dr

The box not yet come to hand, but I suppose will be here ere long. I send by this mail, a spec of Quercus heterophylla from Mt Holly, which is all straight, I also send a specimen from Andalucia, the new locality I wrote about, the leaves are true heterophylla but what about the acorns, in size and shape unlike any I have seen, note the tip of one and the other running nearly to a point (conical), again look at the base of the acorn of the Andalusia spec and the base of the Woodbury the projection corresponding with a depression in the cup. Again the Andalusia spec, how remarkably striate with dark lines the acorn, and mostly smooth shining, the heterophylla Woodbury retains its tomentum till maturity, I hope the way will be open one of these days to give heterophylla

a specific rank, where it seems to me it ought to go. I find in Proceed. of Acad Nat Sci. many years ago an account of a tree in Burlington Co by Buckley which is doubtless the same as my Mt Holly one, How about this Andalusia concern. S

What was the Cuscuta coll. at Quaker Bridge. S

My Dear Do

The box & package reached me a day or two ago, last eve I just got the things out, and find them all returned in good order, and I am greatly obliged for thy labors, as now I will fasten them down, so that there will be no loose acorns to get mixed, &c. Sinctoria is to be restored to a species then is it, & obtusiloba becomes stellata; I had a letter from Dr Barber not long since he had not left Columbia then, I am also obliged for the specimens of oaks & Isoetes; in going over my spec. I find wanting a number which I enclose mem. should any of these come in that thee can spare a specimen for me, I would be glad to fill up. The Japan plants are a great accession to me as most of them were new

to my coll. and the literature I suppose very much scattered at present. I await with interest the closing vol of Californ Bot. and the completion of Gray's cyno[illegible] flora.

Perhaps Eggert might hunt up the hybrid oaks about St Louis I would be glad to pay him usual price, I have had a good many of his plants, and like to encourage such as he in good work.

Anything I can do at this end please command me

Yrs

Resp Friend

Thanks for notes on the Margin of my paper, where needful will use them as explanatory, but; —— please read over the last of the quotation on Oaks — "One of its parents is undoubtedly Phellos for the other we must look among the lobe leaved Black oaks — falcata rubra or coccinea, while the sometimes falcate lobes &c point to the first, (falcata) its frequency in those localities to the second (rubra) we find the tuft &c — intermediate between Phellos & tinctoria & quite different from the other two species, and thus come to the conclusion that the former (Phellos and falcata) must be the parents. this word "former" surely refers to Phellos & falcata, if it had been "latter" then it would have meant, phellos & tinctoria. This is the interpretation

We Philadelphians have put upon it.
How about it.?

Of course "Hybridity" is a "possibility as I understand it. and where two parents unite, and a hybrid is produced, just that possibility would be likely to make another union + another hybrid, whenever the two parents are near enough to be brought in contact, not necessarily that these "hybrids" will be exactly alike for we have the knowledge that they will not; - alike in kind, not in quality some favoring one more than the other, as nutrition or growth force impels; some children favor one parent + some the other owing to immediate causes. We never shall know how the first acorn of Q. bicolor-phylla came, but the fact that the 2 + 3 - generations are just like the parent. and examples being found in distant localities, like that same parent, and thought at places some distances remote still like each other. ought to be an evidence of specific rank. At any rate that is my view of the case. If my view of the foot-note above is correct I would like to put in ( ) after the word former "latter." that it might read "and thus come to the conclusion that the former (latter.) must be the parents". That others may not fall into the same error as myself.

Dear Friend

The receipt of thy Valuable paper on Insects, yesterday satisfies me thy mind is active although the length of years may make a halting step. —— In looking over my Insects I was pleased to find I had to complete a collection, there are one or two species and some of the varieties wanting. I concluded I would just send the whole out to thee which I have done by Express to day, perhaps the may conclude some of the varieties are there, and how about Rowells & Springles collin may they be L. Rowellis? I purchased the whole coll of Ruger, last year a great mass, there speaks of no spec. of his species, named by Shuttleworth, now being known here, the only Insects I have yet found among his plants is the European unless it be found in some bundles of unnamed things, I have had no time to overhaul, but it is quite likely to be correct.

If thee should perchance have a spec
of any of the ones not in my package I
would be glad to have the gaps filled. In
the New Zealand Spicimen I think there is one
with 4 spec. — should thee not have, and
desire a spec — take it off the sheet.
I laid in an oak frame & and a couple of
Junci does thee know them.

Return by Express at my expense when
done with them —

Yours
Jno C Martindale
